

ST002
SCP-1162 & SCP-1200

Invariem

Intermediate Researcher, Scientific Department, Level 2

April 5, 2024

Test Information

Class-D:

- b46194
- DDDEckea591

Combatives:

- grumpypanada10, Security Sr, Security Department, Level 2
- super123qew, Beta-7 Sgt, Mobile Task Force: Beta-7 "Maz Hatters", Level 2

Spectators:

- N/A

1 Question

What will happen when a Class-D with a lack of appendages as a result of interaction with SCP-1162 attempts to eat SCP-1200-29 "Tastes Like Rubik's Cube"?

2 Hypothesis

As a result of previous testing on SCP-1200, I understand that SCP-1200-29 rearranges the appendages of the subject into a cube-like fashion. I believe there's multiple possibilities here and each case will be different. For a subject with less appendages but not a lack thereof, I would infer that the rubik cube effect will still take place and rearrange the appendages into the same position it would've regardless of the lack of other appendages. However, in the case of the subject having no appendages whatsoever, I believe the gum will have no noticeable effect, however I believe there may be some rearrangement of the torso itself, as the torso is split into 3 primary parts which can operate as *appendages*.

3 Procedure

3.1 CDC

I will begin by requesting my test in accordance with the on-site testing procedures format; posting myself at the relevant TSTA. I will request 2 Class-D (CD) and 1 Security Department (SD) personnel. I will prepare my recording software to capture the required evidence necessary for the report. I will now inform the SD to brief the 2 CDs if not already briefed.

3.2 CZ

At the scanners, I will obey orders from combative personnel through the containment zone scanners and request the MTF escort mandated by the AOS, request all items be removed from the Class-D and subsequently make my way to SCP 1162. Based on previous research, SCP-1162 will firstly take the clothing of the Class-D, and then the arms, legs, then finally the head. I will instruct one CD to interact with SCP-1162 until they have no appendages, and another until they have 2 appendages remaining. SCP-1200, where I will instruct CDs to enter the inner-CC and interact rubik cube gum. I will record the observations made, and final vital measurements. In the almost certain event a Class-D will satisfy the termination criteria due to body disadvantage or otherwise, I will ask the combative escort to terminate the Class-D. Additionally, should any Class-D riot occur or disobedience, I will speak with my combative escort and confide in them for protection.

4 Conclusion

Both Class-Ds' appendages were successfully removed and we made our way to SCP-1200. The Class-D which had no appendages observed slight torso alteration potentially due to the condensing of the torso but no other noticeable effects were observed. Furthermore, The Class-D which had half of their appendages removed had their remaining appendages rearranged in a predictable pattern similar to a Class-D unaffected by SCP-1162. These results agree with my hypothesis, however I did not expect the head of the subject to detach from the body in such a manner, and the height of the subject to remain the same - the sizing effect seems to be counteracted by the lack of legs. See [Figure 1](#) and [Figure 2](#)
